

google-ads-mcp — Design Document

Company Name: Nettareion

Business Model: Nettareion is a digital marketing agency that manages Google Ads campaigns on behalf of a small set of clients who have authorized us to manage their advertising. We do not resell access or offer the tool to the general public.

Tool Access/Use: The tool is for internal use only by Nettareion employees and contractors. It runs locally on each operator's machine and is used to review campaign performance and make routine campaign-management changes (e.g. pausing or enabling campaigns, adjusting budgets and bids, adding negative keywords, updating ad copy, applying recommendations) across accounts in our manager hierarchy. There is no hosted service, no public interface, and no external user access.

Tool Design: The tool is a small command-line utility that wraps the official Google Ads API Python SDK. Operators authenticate once via the standard OAuth 2.0 installed-application flow; the resulting refresh token is stored locally in the user's configuration directory. For reporting, the tool runs GAQL queries on demand and returns the results to the operator. For changes, write operations are first validated against the API without committing and a preview is shown; an explicit apply step is required to commit. Each applied change is recorded to a local audit log.

API Services Called: Reporting and account discovery via *GoogleAdsService*, *CustomerService*, and *GoogleAdsFieldService*. Campaign and budget changes via *CampaignService* and *CampaignBudgetService*. Keyword and bid changes via *CampaignCriterionService* and *AdGroupCriterionService*. Ad copy changes via *AdGroupAdService*. Recommendation handling via *RecommendationService*.
